

Script-Controlled ACL – Restrict Record Access Based on Field Value

Description :

This lab demonstrates how to implement a script-controlled Access Control List (ACL) to restrict users from viewing records unless they meet specific conditions. In this scenario, only users belonging to the EEE branch are allowed to view records where the Branch field is set to EEE, while administrators retain full access.

USERS CREATION

User Creation:

1. Log in to the ServiceNow instance with admin access.
2. Create a test user:
 - Navigate to User Administration → Users
 - Click New
 - User ID: EEE User
 - First name: EEE
 - Last name: User
 - Email: eeeuser@gmail.com
 - Save the record

The screenshot shows the ServiceNow 'Users' page. At the top, there's a navigation bar with 'All', 'Favorites', 'History', 'Workspaces', and a 'Users' button. Below this is a search bar and a table of users. The table has columns: User ID, Name, Email, Active, Created, and Updated. The first row is highlighted, showing 'EEE User' with email 'eeeuser@gmail.com'. Below the table, there's a detailed view of the selected user, 'EEE User', with fields for User ID, Email, First name, Last name, Title, Department, Password, Password needs reset, Locked out, Active, Identity type, and Web service. The 'Open Record' button is visible next to the user name in the table.
